Chapter 1

Multivariable Calculus

1.1 Linear Algebra

1.1.1 Vector Spaces

Definition (Normed vector space): Let V be a vector space. A **norm** is a real valued function $\|\cdot\| : V \to \mathbb{R}$ which has the following properties

1. $\forall x \in V,\ \|x\| > 0.$
2. $\|x\| = 0 \implies x = 0.$
3. $\forall x \in V\ \forall \alpha \in \mathbb{F},\ \|\alpha x\| = |\alpha|\,\|x\|.$
4. $\forall x, y \in V\ \ \|x + y\| \leq \|x\| + \|y\|.$

Each normed vector space induces a metric space (V, d) where $d(x, y) = \|y - x\|$.

Theorem 1.1. *In every normed space* $(V, \|\cdot\|)$ *we have*

$$|\|v\| - \|w\|| \leq \|v - w\|$$

Hence the norm is Lipschitz continuous.

Definition: Assume V is a vector space and let $\|\cdot\|_1$, $\|\cdot\|_2$ be two norms for V. They are said to be equivalent when

$$\exists c_1, c_2 > 0\ \forall x : \qquad c_1 \|x\|_1 \leq \|x\|_2 \leq c_2 \|x\|$$

To check if the above definition is indeed an equivalence relation, we must show that following:

Reflexive $\|\cdot\|_1 \sim \|\cdot\|_1$.

Symmetric $\|\cdot\|_1 \sim \|\cdot\|_2 \implies \|\cdot\|_2 \sim \|\cdot\|_1$.

Transitive $\|\cdot\|_1 \sim \|\cdot\|_2$, $\|\cdot\|_2 \sim \|\cdot\|_3 \implies \|\cdot\|_1 \sim \|\cdot\|_3$.

Remark 1. Equivalent norms induce equivalent metrics, hence they induce the same topology.

Theorem 1.2. *All norms defined on a finite dimensional vector space V are equivalent.*

Proof. Let $\|\cdot\|$ be an arbitrary norm on V and $\{e_1, e_2, \ldots, e_n\}$ be a basis of V. Let $\|\cdot\|_2$ be L_2-norm (Euclidean norm). It will suffice to show $\|\cdot\| \sim \|\cdot\|_2$. Let

$$M = \max(\|e_1\|, \ldots, \|e_n\|)$$

Take $x \in V$, writing $x = \sum_{i=1}^n \xi_i e_i$ we have:

$$\|x\| = \left\|\sum_{i=i}^n \xi_i e_i\right\| \leq \sum_{i=1}^n |\cdot| \, \xi_i \, \|e_i\| \leq M\sqrt{n}\, \|x\|_2$$

Taking $c_2 = M\sqrt{n}$ proves the right inequality. For the left inequality we need the following lemma

Lemma 1.3. *If V is a normed vector space with $\|\cdot\|_2$, as defined above, is viewed as metric space $(V, \|\cdot\|_2)$ then $\|\cdot\| : V \to \mathbb{R}$ is continuous.*

Proof. Let $x_0 \in V$ and M be defined as above. For any $\epsilon > 0$ consider $\delta = \frac{\epsilon}{M\sqrt{n}}$ then if $\|x - x_0\|_2 < \delta$

$$|\|x\| - \|x_0\|| \leq \|x - x_0\| \leq M\sqrt{n}\, \|x - x_0\| \leq \epsilon$$

Now consider the sphere of radius $r = 1$ centered at 0, $S_1(0) = S_1 = \{x \in V : \|x\|_2 = 1\}$. One can show that S is compact. Therefore, $\|x\|$ assumes its minimum on S. Let $a = \|x_0\|$ be the minimum. Since $0 \notin S$ then $a > 0$. By letting $y = x/\|x\|_2$, we have $y \in S$ and thus $a \leq \|y\|$ which is

$$a\,\|x\|_2 \leq \|x\|$$

Taking $c_1 = a$ proves the theorem. ∎

Theorem 1.4. *Let $(V, \|\cdot\|)$ be a normed space. The following are equivalent*

1. *V is finite dimensional.*
2. *every bounded closed set in V is compact.*
3. *the closed unit ball in V is compact.*

Proof.

Definition (Banach space): A normed vector space V that is complete is a **Banach space**. A **Hilbert Space** is a Banach space whose norm is induced by an inner product.

Corollary 1.5. *Any finite dimensional normed vector space V is a Banach space.*

1.1.2 Linear Maps

Let V and W be a vector spaces over $\mathbb{F}$. A map $T : V \to W$ is **linear** if

$$T(x + \lambda y) = T(x) + \lambda T(y)$$

for all $x, y \in V$ and $\lambda \in \mathbb{F}$.

Definition: Let $(V, \|\cdot\|_V)$ and $(W, \|\cdot\|_W)$ be normed spaces then, a linear transformation $T : V \to W$ is **bounded** if there exists a constant $C > 0$ such that

$$\|Tv\|_W \leq C \|v\|_V$$

for all $v \in V$. We denote the set of all linear map from $V \to W$ as $\mathcal{L}(V, W)$. If $T \in \mathcal{L}(V, W)$ is bijective such that $T^{-1} \in \mathcal{L}(V, W)$, then T is called an **isomorphism** and V, W are **isomorphic**. An operator $T \in \mathcal{L}(V, W)$ is called **isometric** if $\|Tv\|_W = \|v\|_V$ for all $v \in V$.

Definition: If $(V, \|\cdot\|_V), (W, \|\cdot\|_W)$ are normed spaces then the **operator norm** of a linear transformation $T : V \to W$ is

$$\|T\| = \sup\left\{\frac{\|Tv\|_W}{\|v\|_V}\middle| v \neq 0\right\}$$

Theorem 1.6. *Let $(V, \|\cdot\|_V)$ and $(W, \|\cdot\|_W)$ be normed spaces and $T : V \to W$ be a linear transformation. The following are equivalent*

1. *$\|T\|$ is finite.*
2. *T is bounded.*
3. *T is Lipschitz continuous.*
4. *T is continuous at a point.*
5. *$\sup_{\|v\|_V = 1} \|Tv\|_W < \infty$.*

Proof. item 1 ⇒ item 2: Obviously

$$\begin{aligned} \frac{\|Tv\|_W}{\|v\|_V} &\leq \|T\| \\ \implies \|Tv\|_W &\leq \|T\| \|v\|_V \end{aligned}$$

note that if $v = 0$ then $Tv = 0$ as well and thus the last inequality holds for all $v \in V$.

item 2 ⇒ item 3:

$$\|Tv - Tu\|_W = \|T(u - v)\|_W \leq C \|u - v\|_V$$

item 3 ⇒ item 4: Trivial.

item 4 ⇒ item 5: Let T be continuous at $u \in V$. Then there is a $\delta > 0$ such that

$$\|v - u\| < \delta \implies \|Tv - Tu\|_W = \|T(v - u)\|_W < 1$$

Now for an arbitrary non-zero v we have

$$\left\|\left(\frac{\delta v}{2\|v\|_V} + u\right) - u\right\|_V < \delta$$

Therefore

$$\left\| T\left(\frac{\delta v}{2\left\|v\right\|_V}\right)\right\|_W < 1$$
$$\left\| T\left(\frac{v}{\left\|v\right\|_V}\right)\right\|_W < \frac{2}{\delta}$$

item 5 $\Rightarrow$ item 1: Let $v \in V$ be an arbitrary vector. Then

$$\sup \left\| T\left(\frac{v}{\left\|v\right\|_V}\right)\right\|_W < \infty$$
$$\Longrightarrow \sup \left\|Tv\right\|_W < \infty$$

Theorem 1.7. *For two normed vector spaces V, W, $(\mathcal{L}(V, W), \|T\|)$ is a normed vector space. Moreover, it is a Banach space when W is a Banach space.*

Proof.

Theorem 1.8. *Let $(V, \|\cdot\|)$ be a normed space. Then any linear transformation $T : \mathbb{R}^n \to V$ is continuous. Furthermore, if T is a bijection, it is a heomeomorphis.*

Proof.

Theorem 1.9. *$f : \mathbb{R}^n \to \mathbb{R}^n$ linear transformation is invertible if and only if there exists a c such that:*

$$c\left\|x\right\| \leq \left\|f(x)\right\|$$

Proof. A linear transformation $f : \mathbb{R}^n \to \mathbb{R}^n$ is one-to-one if and only if it is surjective because $\dim \operatorname{Im} f + \dim \ker f = n$. Hence, we only need to show that f is one-to-one. ■

Exercises

1. Show that for a linear transformation T, $\|T\| = \sup_{\|v\|_V \leq 1} \|Tv\|_W$.

1.2 Derivative

Let $f : U \subset \mathbb{R}^n \to \mathbb{R}^m$ where U is open. Then f is differentiable at x_0 when a linear transformation $T : \mathbb{R}^n \to \mathbb{R}^m$ such that

$$\lim_{\|h\| \to 0} \frac{\|f(x_0 + h) - f(x_0) - T(h)\|}{\|h\|} = 0$$

Usually, T is represented by $f'(x_0)$, $\mathrm{D}\, f$, or $\mathrm{d}\, f(x)$.

Proposition 1.10. *Assume $f : U \subset \mathbb{R}^n \to \mathbb{R}^m$ is differentiable at x_0 and let $u \in \mathbb{R}^n$ then*

$$\lim_{t \to 0} \frac{f(x_0 + tu) - f(x_0)}{t} = f'(x_0) \cdot u$$

Definition (Partial derivative): define

Proposition 1.11. *If f is differentiable then its partial derivatives exist.*

Proposition 1.12. *$f : U \subset \mathbb{R}^n \to \mathbb{R}^m$ is differentiable at x_0 if and only if every component is differentiable at x_0.*

Theorem 1.13. *$f : U \subset \mathbb{R}^n \to \mathbb{R}^m$ has all of its partial derivative and they're continuous then f is differentiable.*
